

ABSTRACT OF THE DISCLOSURE

A plant tray includes a plastic body with plural accommodations. The accommodations are open both at the bottom and at the top. A plant is inserted at the top and the roots, which can be brought into contact with water, are able to develop through the bottom. The boundary of an opening at the bottom of the tray has a cutting edge to be able to remove the plant easily and to prevent the roots growing together into a solid mass. Plates extending into the accommodations can be provided for clamping plants, such as bulbs.
